UPDATE: ENMAX Power Transformer Allocation Strategy

ENMAX Power will end the Transformer Allocation Strategy effective November 13, 2023

Background

In September 2022, ENMAX Power informed the development community of a global supply chain challenge facing the entirety of the electricity industry. Following several shipment delays and partial deliveries from our suppliers, ENMAX Power took several actions to respond to the challenge. From increasing our suppliers and orders, the introduction of the Transformer Allocation Strategy and consistent communication with the development community regarding the challenge and status. **The Transformer Allocation Strategy proved successful in avoiding a complete stock-out situation.**

As communicated in September 2022, ENMAX Power anticipated the end of the Transformer Allocation Strategy by the end of 2023. With the supply chain stabilizing and October shipments received, **ENMAX Power will end the Transformer Allocation Strategy effective, November 13, 2023.**

Moving Forward

With the end of the Transformer Allocation Strategy, ENMAX Power will no longer be deferring transformers on jobs currently in progress and any new Developments entering construction. With the high volume of lots to be completed in Q4 2023, the current priority is to focus on timely energization for each in progress site.

ENMAX Power will **continue with the current practice of requiring a developer to place a request** for any required deferred transformer for the remainder of the year and developments will continue to receive transformers based on the demand requirements for each site. In early 2024, ENMAX Power will begin to install the outstanding transformers in a systematic manner with the goal to have the balance installed by the end of Q1, 2024.

Please contact your ENMAX Project Manager if you have any questions.

Thank you to the development community for working together with us to accomplish our collective goal to minimize the impact of this global challenge facing our industry.
